

Activation

Activation is a **one-time process** which must be performed correctly, in order to create the environment that will grow and foster the bacteria needed to produce biogas inside the HomeBiogas system.

5 steps for successful activation:

1

Temperature

needs to be at least 25 degrees Celsius/ 77 degrees Fahrenheit when activating the HomeBiogas system.

2

Fresh manure

is the key to a successful activation process. The manure can be from cows/sheep/goats/horses/pigs.

It should be wet, fresh (up to 2 days old) and free of straw/earth/stones. Make sure your mix is 1:1 ratio (manure : water) before adding it to the system.

3

Wait for flammable gas to appear (2-5 weeks)

Only when the flame is stable you can start feeding the system with food waste. (DO NOT feed earlier)

4

Feed gradually

for the first 2 weeks. Up to half of the amount allowed according to the user manual.

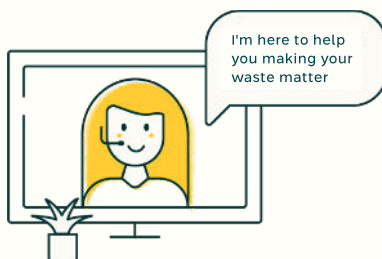

5

Use system normally
